Abstract

Working with a panel dataset of OECD countries over the decade 1994-2004, we examine linkages between cross-border trade and FDI in the services sectors. We first develop a consistent analytical framework for the application of the gravity model to both services trade and commercial presence (i.e. FDI), using a composite model of delivery that offers testable hypotheses about the roles of different modes of services supply as complements or substitutes. We further link our estimates to policy variables measuring market regulations that may act directly or implicitly as barriers to trade. We find robust evidence of complementary effects in the short run, which is reinforced in the long run by an increased potential for cross-border imports based on previous FDI inflows. A detailed analysis by individual services sectors highlights business, communication and financial services as showing the largest potential for cross-border trade when market regulations are reduced and when commercial presence increases.

Cross-border trade and FDI in services

1 Introduction

Whether or not cross-border trade and foreign direct investment (FDI) act as complements or substitutes in delivering goods across borders is not a new question. What is new in the literature is the recent attention to services, as distinct from goods. Fontagné and Pajot (1999) provide a comprehensive overview of the rich pool of literature dealing with the subject as it relates to goods. They stress that this relationship depends on the level of analysis. At the firm level one will expect trade and FDI to be substitutes, while there are compelling reasons – based on New Trade Theory arguments – for a complementary relationship at the macro level (Pfaffermayr, 1996). Given these distinctions, which are extended in Egger and Pfaffermayr (2005) to include further the magnitude of plant set-up costs compared to trade costs, the empirical findings to date have remained inconclusive. Fontagné and Pajot (1999) have ascribed this to a confusion of effects at different levels of the economy (firm, industry and macro level) and to differences between vertical and horizontal FDI, two points that are both widely accepted in the literature (Zarotiadis and Mylonidis, 2005; Egger and Pfaffermayr, 2005, among others). Reading through the empirical literature suggests that the case for complementarity between trade and FDI is stronger for vertical FDI and rather low trade costs. This is intuitively compelling given that the majority of FDI takes place between high-income developed countries, where vertically integrated production networks involving FDI are expected to play a greater role than between partners at different levels of economic development.

Both types of relationship are consistent with viewing trade and FDI as two equivalent modes for the international provision of goods. Cross-border trade and FDI can therefore be seen as two modes for firms to deliver goods internationally. When we turn to services, the General Agreement on Trade in Services (the GATS) actually explicitly lists four different modes for producer delivery of services across international borders: cross-border delivery, movement of consumers, firm establishment, and temporary movement of persons linked to services. The most important of these are cross-border trade (known in GATS-speak as ‘mode 1’) and sales through local establishments, i.e. through FDI (known in GATS-speak as ‘mode 3’). Mainly due to data limitations, the question of whether these different modes act as complements or substitutes in services trade has rarely been dealt with in the literature.¹

¹ The approach taken in the literature is gravity modelling. An early example looking at different services sectors, based on bilateral US services trade data, is Francois (1993). More recently, Fontagné (1999), Magalães and Africano (2007), Hejazi and Safarian (2001) and Bos and van de Laar (2004, also look at this issue for total services. At a sectoral level, see Buch and Lipponer (2007) for German banks, Moshirian (2001) and Moshirian et al. (2005) for banking, and Li et al. (2003) for insurance services.

There are reasons to believe that the relationship between cross-border trade and FDI may well be different for services than for merchandise. Banga (2005) points out that while the determinants for FDI are generally found to be the same for goods-producing firms and for services-delivering ones, the importance of these determinants differs strongly between the two sectors. Government regulations, policies, cultural distance and the tradability of services (influenced by technological progress as well as by economic policy and regulatory measures) are the prime factors influencing FDI in services. In contrast, market size, barriers to trade and cost differentials in production are the main determinants for FDI in goods.

Evidence on whether cross-border and establishment modes of international services delivery act as complements or substitutes is thin and inconclusive. Some studies find no evidence, such as Brenton et al. (1999) for the aggregate, or even mixed results when individual products or countries are studied, such as Bloningen (2001), Pain and Wakelin (1998) or Fontagné and Pajot (2000). Moshirian (1997) does find a substitutive relationship for insurance services, as do Kolstad and Villanger (2004) for a disaggregate set of four services sectors. The question has immediate policy relevance, as it determines the meaning of differential liberalization commitments taken under alternative modes (Francois and Wooton, 2001).

In this paper we explore the degree of complementarity between trade and FDI in services over both short- and longer-run time horizons. We work with a newly constructed dataset that combines data for cross-border and establishment modes of trade for 28 OECD countries over the period 1994 to 2004, distinguishing between total services and seven individual services sectors. The next section describes the dataset in more detail, highlighting an apparent short-run interaction between cross-border trade and FDI in the services sector. In Section 2 we develop our estimating framework from an analytical structure involving composite delivery modes. Section 3 offers evidence of the short-run relationship between trade and FDI in services, at the aggregate level and by service, both in the traditional and the new composite demand approaches. The complementarity between FDI and cross-border trade is corroborated in Section 4 by a long-run analysis, where FDI shows an important long-run effect on services imports. We offer conclusions in Section 5.

2 Data and basic trends

Our dataset merges information from a number of different sources (IMF, OECD, World Bank). Data on services imports, covering basically modes 1 and 2, come from published IMF Balance of Payments Statistics, compiled according to BOP Manual 5. FDI stock data, as a proxy for mode 3 trade, are taken from OECD Source and classified by the OECD's own industry classification based on ISIC, revision 3. The time period covered ranges from

1994 to 2004. The combination of the two datasets implies that the sample covers 28 OECD countries.² The data are mapped to individual services sectors according to the BOP classification. We have left out sectors where the number of missing observations exceeded the observations that were actually reported. Thus, we focus on the following categories: total services, transport, travel, communication, construction, finance, and other business services. We have approximately 200 observations per service category. All other macroeconomic indicators come from the World Development Indicators published by the World Bank (i.e. GDP, value added, purchasing power parities), while distance is taken from CEPII's distance dataset and exchange rates from the IMF International Financial Statistics.

For measures of regulation, we use the set of OECD Product Market Regulation indicators or PMR indicators (see Conway et al., 2005). These cluster a variety of different regulatory measures into three groups: barriers to entrepreneurship, state control and barriers to trade and investment. Barriers to entrepreneurship and state controls are essentially inward-oriented regulations; trade and investment barriers act as outward-oriented regulations, and are more likely to be affected by international negotiations. The latter are split into foreign ownership barriers, regulatory barriers and tariffs. The indicators are normalized to a scale between 0 and 6, higher values indicating more burdensome regulation.

Figure 1

Source: IMF BOP Statistics.

² While cross-border trade at the sectoral level (BOP classification) is in principle available for 178 countries in the world, detailed and comparable FDI data by sectors are only available for the OECD members. Consequently our sample contains all OECD countries without Belgium and Luxembourg.

We focus on the interaction between the two modes of supply, namely across the border (including here also movement of consumers) and through foreign establishment. We would ideally measure mode 3 trade by the sales of foreign affiliates in the services sector. However, such data only exist for a limited number of countries. Indeed, the US is more or less the only country that publishes comprehensive FATS (Foreign Affiliates Trade in Services) statistics on a consistent basis. Therefore, without apology we use services sector FDI stocks in the country as a very rough proxy for services supply through foreign establishment. Estimates by the World Bank (Hoekman, 2006) indicate that this is reasonable, and that for the US the ratio between inward FDI stocks in services and trade through foreign affiliates in the same sector is about 3:1. This means we can roughly quantify the importance of mode 3 trade by taking one-third of FDI stocks. This scaling effect has to be considered when interpreting the figures presented below.

Trade in services has in general risen in the OECD over the past decade. Figure 1 displays the growth in import volume and FDI inward stocks for total services. One sees an over-proportionate increase in FDI stocks. Even with our rule of thumb that only a third of this can be seen as mode 3 trade, the data still suggests a relative shift towards trade through commercial presence. While a decade ago cross-border trade was by far the most important mode for trade in services (USD 840 billion of services sector FDI stocks corresponding to USD 280 billion of mode 3 trade as compared to USD 770 billion of cross-border services imports), by 2004 FDI stocks amounted to USD 3300 billion while service imports just about doubled to USD 1300 billion for the OECD in total. Thus, towards the end of the observation period, the two modes attained equal importance.

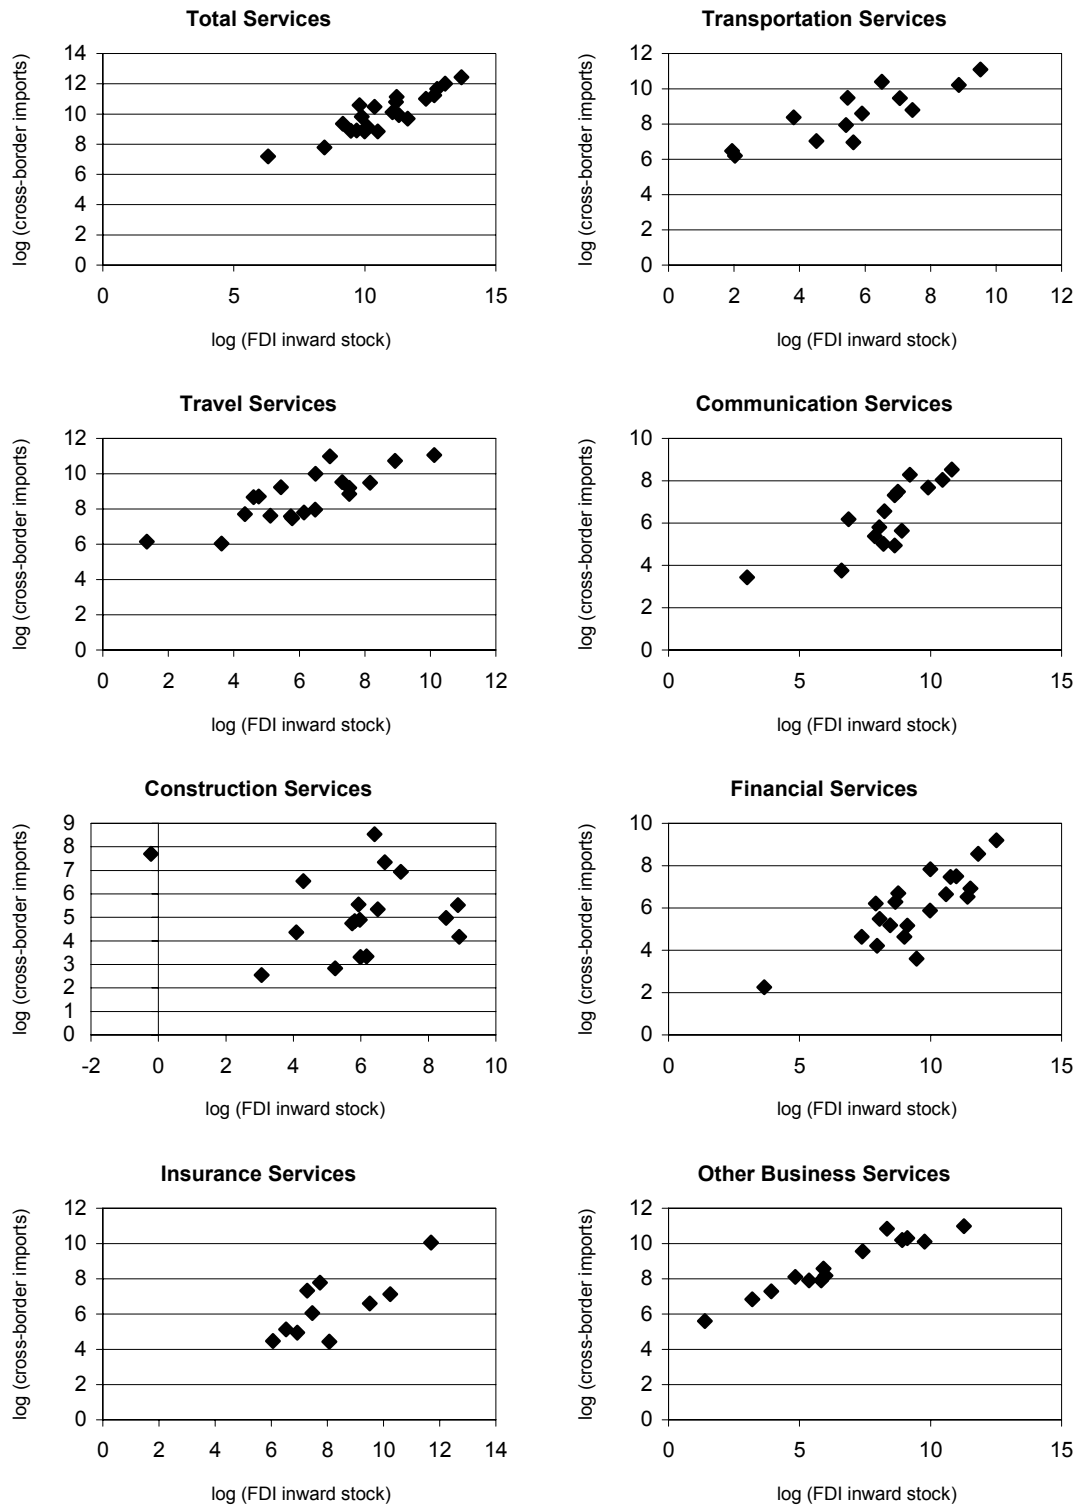

Figure 2

Source: IMF BOP Statistics, IMF IFS Statistics.

Figure 3

Correlation between alternative modes by sector, average 2001-2004

Source: Own calculations based on IMF and OECD data.

Figure 2 shows a sectoral breakdown of imports through trade and establishment by three main sectors, transport, travel and the sum of the remaining five categories listed above – producer services.³ It becomes evident from Figure 2 that this category is strongly responsible for the high growth of FDI in the service sector. The tremendous growth in service sector FDI is almost entirely driven by producer services. Also, it is the most important category for cross-border trade in services in the OECD. Growth through modes 1 and 2 has not been as impressive as through FDI. However, trade flows have nevertheless doubled over the past decade in all three categories. Thus, we observe an increase in trade in services through either mode. This clearly positive trend implies a shift towards trade through foreign affiliates, though the rough data do not allow us to speculate at this point whether this implies a substitute relationship or a form of complementarity.

More details about this relationship between different modes of services supply are given in Figure 3, which plots FDI inward stocks against services imports for all 28 countries for each services sector separately. The graph shows the average level of cross-border imports and FDI stocks in current US dollar terms over the period 2001-2004. For all services sectors with the exception of construction services we see a positive relationship. Thus, more inward FDI in a country is observed together with more services imports in the same sector. This very preliminary look at the data suggests a contemporaneous complementarity between trade and FDI in services.⁴

3 Linking trade and FDI in services

Conceptually, cross-border services trade and foreign affiliate sales may be substitutes or complements. On net, there are several reasons to expect that they are more often gross complements in production (i.e. joint inputs) though with some degree of substitution possible. For example, because services require interaction between provider and consumer (Hill, 1977; Francois, 1990), it will usually be the case that cross-border trade in services requires some local value added to facilitate interaction between provider and consumer. In addition, from available balance of payments and trade data, we observe both trade and FDI across services sectors. If we are willing to assume that FDI in services is a reasonable proxy for affiliate sales in services, this means we observe both cross-border and affiliate sales.

In formal terms, we start with a general representation of delivered services S as a composite of cross-border traded inputs T and affiliate activities F . This may, for example,

³ This refers to the sum of communication, construction, finance, insurance and other business services. Due to too many missing observations, this group does not reflect all categories usually labelled 'producer-related services'. Specifically we are missing out here: computer and information services and royalties and licence fees.

⁴ For the period 1994-1997, the same positive relationship was observed for all services sectors, also for construction services. We had to omit insurance services from the analysis, since data for the complete sample were only available for one year and hence the small number of observations did not allow a meaningful econometric analysis.

involve a banking product supported by headquarter activities but sold and serviced through a local office. Formally, we represent total foreign sales of services as a CES composite (equation 1), where $\sigma=1/(1-\rho)$ is the Allen-elasticity of substitution across modes.

$$S = f(F, T) = A \left(a_F (F)^\rho + a_T (T)^\rho \right)^{1/\rho}, \quad 0 \leq \rho \leq 1 \quad (1)$$

If sales through affiliates and through cross-border trade (F and T) are perfect substitutes, then

$$S = A(a_F F + a_T T), \quad \rho = 1 \quad (2)$$

In more general terms, from the first order conditions for cost-minimization starting from (1), we have the following relationship between cross-border and establishment inputs to final delivery:

$$F = SA^{-1} \left(\frac{a_F}{P_F} \right)^\sigma P^\sigma = SA^{-(1+\sigma)} \left(\frac{a_F}{P_F} \right)^\sigma \left(a_F^\sigma P_F^{1-\sigma} + a_T^\sigma P_T^{1-\sigma} \right)^{\sigma/(1-\sigma)} \quad (3, 4)$$

$$T = SA^{-1} \left(\frac{a_T}{P_T} \right)^\sigma P^\sigma = SA^{-(1+\sigma)} \left(\frac{a_T}{P_T} \right)^\sigma \left(a_F^\sigma P_F^{1-\sigma} + a_T^\sigma P_T^{1-\sigma} \right)^{\sigma/(1-\sigma)}$$

$$P = A^{-1} \left(a_F^\sigma P_F^{1-\sigma} + a_T^\sigma P_T^{1-\sigma} \right)^{1/(1-\sigma)} \quad (5)$$

In equation (5), P is the price of the delivered service S . Normalizing service quantities so that we represent import demand for delivered services as $S = P^\varepsilon$, $\varepsilon < 0$ where ε is the elasticity of demand, then from equations (3-5)⁵ it is straightforward to link demand for cross-border and local services sales to changes in the price of cross-border and local affiliate inputs.

$$\frac{dT}{dP_F} = (\varepsilon + \sigma) \left(P^{\varepsilon+2\sigma-1} a_F P_F^{-\sigma} \left(\frac{a_T}{P_T} \right)^\sigma A^{\sigma-2} P_F^{-1} \right) \quad (6,7)$$

$$\frac{dT}{dP_T} = - \left(P^{\varepsilon+\sigma} \left(\frac{a_T}{P_T} \right)^\sigma \left(-\varepsilon a_T^\sigma P_T^{1-\sigma} + \sigma a_F^\sigma P_F^{1-\sigma} \right) A^{\sigma-2} P_T^{-1} \right)$$

A similar set of equations hold for F . From equation (6), the impact of a drop in the price of providing local affiliate inputs on cross-border trade depends on the elasticity of substitution between F and T , and the underlying elasticity of demand for composite services S . If the elasticity of substitution is relatively low – in particular if $\sigma < |\varepsilon|$ – then they actually serve as gross complements. Alternatively, as long as $\sigma > |\varepsilon|$, they will serve as gross substitutes.

We have seen dramatic increases in FDI flows in the services industries in the past ten years, along with moves to privatize and deregulate services sectors. Liberalization of

⁵ In Ethier-Krugman-Melitz-type models, this elasticity is from the elasticity of substitution across varieties. With appropriate normalizations, such CES demand structures allow aggregation, across firms and regions.

services sector FDI means a reduction in the cost of running local affiliates. From equations (3,4) this implies a rising share of local affiliate relative to cross-border sales. Controlling for overall growth in demand, the theoretical impact on cross-border sales is ambiguous. From equations (6,7), it will depend on the elasticity of substitution relative to the elasticity of demand. We can summarize the implications of local services sector liberalization and related FDI liberalization as follows:

- In the cross-section, net complementarity of F and T means a relatively low technical degree of substitution
- Over time, increases in total services sales S imply rising both cross-border trade and FDI
- Controlling for shifts in demand, the impact of FDI growth driven by local market liberalization over time on cross-border trade is ambiguous

Technical change affecting delivery modes has a similar set of implications. In our data, we will look at trade–FDI interactions at both the cross-section and dynamic panel levels. In the cross-section, complementarity will tell us we have a relatively low degree of substitution between cross-border and local sales of services. In the dynamic panel, we are interested in the relative evolution of cross-border and affiliate sales.

4 The cross-section view and the impact of regulation

In this section we analyse the effect of inward FDI on cross-border services trade and *vice versa* from a short-run point of view. We estimate first a traditional gravity model for the cross-country panel dataset, where we do not control for regulatory interactions and where we capture the complementary or substitutive effect between FDI and services imports by including trade through the alternative mode as a further control variable on the right-hand side. In particular, taking logs, equations (3) and (4) yield a standard form of the gravity equation.

$$\begin{aligned}\ln F_i &= \ln S_i - \ln A + \sigma \ln a_{Fi} - \sigma \ln P_{Fi} + \sigma \ln P_i \\ \ln T_i &= \ln S_i - \ln A + \sigma \ln a_{Ti} - \sigma \ln P_{Ti} + \sigma \ln P_i\end{aligned}\tag{8,9}$$

In equations (8,9), the subscripts i denote importers. We will be using data on FDI as a proxy for affiliate activities F in equation (8). We use GDP and Population as proxies for services import expenditures S . As it is a standard result in the gravity literature to find trade costs rising with distance, we also include the latter as a determinant of P_{Ti} and P_{Fi} in our estimating equations below.⁶ From our definition of P we also include FDI in our equation for trade T and *vice versa*. Since there may be a certain time lag in the relationship, we use here the first lag of the alternative mode. Our estimating equations are given below:

⁶ There are many paths that lead to the now standard functional relationship we use here, inclusive of importer and exporter fixed effects and economic distance terms. See Baldwin and Harrigan (2007) for an overview. Also see Evenett and Keller, 2002; Anderson, 1979; Anderson and Marcoullier, 2002; Anderson and van Wincoop, 2003; and Deardorff, 1988.

$$\begin{aligned}
\ln M_{it} &= b_{0,M} + b_{1,M} \ln dist_{it} + b_{2,M} \ln GDP_{it} \\
&\quad + b_{3,M} \ln POP_{it} + b_{4,M} \ln FDI_{i,t-1} + e_{M,it} \\
\ln FDI_{it} &= b_{0,F} + b_{1,F} \ln dist_{it} + b_{2,F} \ln GDP_{it} \\
&\quad + b_{3,F} \ln POP_{it} + b_{4,F} \ln M_{i,t-1} + e_{F,it}
\end{aligned} \tag{10,11}$$

In equation (10), $M_{it}=T_{it}$ represents the total cross-border services imports for country i and year t , FDI_{it} are total FDI stocks in the services sector in country i and year t , GDP is the gross domestic product for country i and year t (measured in current international dollars), POP is the population of the host country, and $dist$ is a GDP-weighted average distance term for the host country to all potential trading partners. (The $dist$ term can be seen as an index of general remoteness of the country.) Finally e represents error terms with an unobservable country-specific component and a remainder disturbance. We estimate the within or fixed effects model where the country-specific effect and all the regressors are assumed to be independent of the disturbance. The bias of omitting variables is controlled for in this way. (Recall that we have a sample of 24 countries over ten years, although there are some missing values in this sample. Data sources are described in the previous section.) Similarly, time variables (where appropriate) help control for time-varying aspects of omission errors.

Tables 1a and 1b show the estimation results for the traditional, uncontrolled gravity approach in the first column. Services imports receive a significant complementary effect from commercial presence (Table 1a), but we do not find this complementary relationship to be significant in the opposite direction. From the regression results, no significant evidence for a trade impact of cross-border imports upon commercial presence is found (Table 1b).

From our discussion of composite delivery, equations (6) and (7), and corresponding versions for FDI, point to an impact of cost factors in one mode (like regulatory restrictions) in delivery through the alternative modes. This suggests that one should test for interactions between cross-border and establishment modes by focusing on that impact. To implement this formally we work with an augmented gravity equation where the barriers on alternative modes for services trade are controlled:

$$\begin{aligned}
\ln M_{it} &= c_{0,M} + c_{1,M} \ln dist_{it} + c_{2,M} \ln GDP_{it} + c_{3,M} \ln POP_{it} \\
&\quad + c_{4,M} PMR_{it} + c_{5,M} (PMR_{it}) (\ln FDI_{i,t}) + e_{M,it} \\
\ln FDI_{it} &= c_{0,F} + c_{1,F} \ln dist_{it} + c_{2,F} \ln GDP_{it} + c_{3,F} \ln POP_{it} \\
&\quad + c_{4,F} PMR_{it} + c_{5,F} (PMR_{it}) (\ln M_{i,t}) + e_{F,it}
\end{aligned} \tag{12,13}$$

In equations (12) and (13), PMR is an index of product market regulation controlling for explicit and implicit barriers for services trade through domestic regulation. This comes

from the OECD and is described in more detail in the data section of the paper. We have tested the price and cross-price effects for each category of regulation. The advantage of this specification is that we decompose the change in trade in each mode due to changes in regulations into a direct price effect and into cross-price effects working through the alternative mode to trade the respective service. Taking as an example the services imports equation,

$$\frac{\partial(\ln M_{it})}{\partial PMR_{it}} = c_{4,M} + c_{5,M} \ln FDI_{i,t} \quad (14)$$

Here, the term $c_{5,M}$ indicates the complementary or substitutive effect received from FDI when the barrier restricting this mode changes. From equations (6,7) this effect depends on the demand and substitution elasticities, and measures net cross-price effects. The results of these price effects for total trade in services are presented in the remaining columns of Tables 1a and 1b.

At first glance, variation in product market regulations in general affects trade within the same mode directly and through the respective other mode. We see in both panels of Table 1a negative direct price effect, meaning that more regulation impedes trade as expected. This results from the interpretation of higher values of the *PMR* indicators with more burdensome regulation and a consequently more restricted (and more costly) access to the corresponding market. The cross-price effect, working through the alternative mode of trade, is always of the opposite sign (positive). This points towards a complementary relationship, because the negative price effects from an increase in regulations are reflected in a simultaneous negative effect on the alternative mode. In other words, those countries with higher regulations experience a lower level of services imports and of foreign commercial presence, which is much lower because of the complementarity between both modes of trade. In more detail, the incidence of individual aspects of regulation differs between modes (cross-border and through FDI). For services imports we see significant negative effects from higher trade and investment barriers – due to foreign ownership regulations – and from state controls; cross-border imports also receive a positive cross-price effect from inward-oriented regulations, though here we do not find a significant direct price effect. For trade through foreign establishment (proxied by FDI) we find a direct negative price effect from all aspects of regulation with the exception of tariffs. Cross-price effects (working through cross-border trade) are significant only when looking specifically at inward-oriented regulations (here arising from barriers to entrepreneurship) and trade and investment barriers (here stemming from regulatory burdens and restrictions on foreign ownership). For all aspects of regulation we find evidence of complementarity between FDI and services imports. Foreign ownership barriers stand out as the only category with a reciprocal relationship where both direct price and indirect cross-price effects significantly affect trade through both modes. In summary, in the short run there is evidence of significant complementarity between cross- border trade and commercial presence in aggregate services.

Since total services comprise a very heterogeneous collection of highly different activities, it is interesting to analyse the relationship between individual modes of delivery and their reaction on regulatory changes for each service sector separately. For this we have replicated the set of estimates for each service activity separately. The price and cross-prices elasticities are summarized in Tables 2a and 2b. The evidence is more dispersed with fewer instances of evidence for complementarity than for total services. However we wish to highlight the case of communication services. For this sector there is strong evidence of complementarity in its response to all regulatory changes, except the regulatory obstacles to trade and investment. We also find some evidence for significant effects of regulatory barriers for business services and for financial services. In the latter

case – like for transportation services - we find an unexpected positive direct effect from higher tariffs on trade value. This may be explained by a statistical peculiarity in the case of transportation services, which are often constructed from merchandise trade flow statistics. Higher tariffs might increase the costs of shipping goods, which may falsely be counted as being part of the transportation service. Table 2b shows weaker evidence for FDI, with only some direct price effects for communication, construction and financial services. Transportation services again show an unexpected positive direct effect from tariffs.

Note: Each cell corresponds to a separate gravity regression. Detailed estimations in Appendix 1B. Figures in bold mean significant at the 10% level or more; t-statistics in italics.

To sum up, we find a robust complementary effect between commercial presence and cross-border trade in services, which is not always captured when we do not control for

cross-price effects linked to regulation. The composite delivery approach allows us to capture this effect through the cross-price effect when changes in product market regulations (being an indication of market access barriers) which affect both FDI and cross-border trade are taken into account. From this perspective the complementarity is clearly reciprocal between the two modes of supply. This is especially true when obstacles to foreign ownership are considered. Looking at individual service sectors, we again find a complementary relationship when the service activity shows a significant direct reaction to changes in the regulatory environment. The sensitivity towards such changes differs however between service sectors, with some of them, such as communications services, responding to all facets of regulation, some others being responsive to certain aspects of regulation - financial and other business services – while the rest – construction and communication – hardly show any sensitivity. At the detailed sector level the evidence for complementary effects through FDI on cross-border trade is generally stronger than for the opposite direction, though this varies by sector.

5 Complementarity over time: trade through FDI

Having established complementarity between FDI and cross-border imports in the short-run, we next focus on how this relationship evolves over time. There is a recent literature on long-run effects and the causal relationship between international investment and trade in goods (see Barrell and te Velde 2002, Türkcan 2006, Pramadhani et al., 2007, Pacheco-López, 2005 or Pain and van Welsum, 2004). In this section we formulate a simple partial adjustment model as used by Pesaran and Smith (1995) and Pesaran et al. (1999) and apply it to trade in services like in Pain and van Welsum (2004). Unlike Pain and van Welsum, we include controls for direct and indirect regulatory cost impacts. For our 10-year sample, the estimated long-run coefficients are meant to test for complementarity or substitution in the long run between different modes. We start with the following dynamic relationship:

$$\ln Y_{it} = \alpha_i + \beta_i \ln X_{it} + \lambda_i \ln Y_{i,t-1} + e_{it} \quad e_{it} \sim \text{IN}(0, \sigma_i^2) \quad (15)$$

where Y_{it} is cross-border trade (or the commercial presence respectively), $i=1\dots N$ is the country and $t=1\dots 10$ are years, and X_{it} denotes the alternative mode of trade. We want to test for the existence of a long-run relationship between the two modes. In the case of a positive relationship we can consider this as an indication of complementarity, while the opposite would be a sign of substitution. The associated long-run coefficients can be derived as $\theta_i = \beta_i / (1 - \lambda_i)$. The country-specific intercept picks up all omitted factors that vary across countries. A convenient re-parametrisation of (15) is:

$$\begin{aligned} \Delta \ln Y_{it} &= \alpha_i - (1 - \lambda_i) \left[\ln Y_{i,t-1} - \frac{\beta_i}{1 - \lambda_i} \ln X_{it} \right] + u_{it} \\ \Delta \ln Y_{it} &= \alpha_i - \gamma_i \left[\ln Y_{i,t-1} - \theta_i \ln X_{it} \right] + u_{it} \end{aligned} \quad (16,17)$$

(1) Short run estimation for the composite demand approach with the long run sample, to control for potential sample bias.

Note: Figures in bold mean significant coefficients at 10%-level or more; t-statistics in italics.

From this non-linear equation we can estimate the long-run parameters of interest: θ and γ . In a first simple experiment we assume that there are negligible differences between countries in the long-run price and cross-prices elasticities. This yields estimates that are more or less comparable with our short-run within estimates from the previous section.⁷

The estimating equation then becomes:

$$\Delta \ln Y_{it} = \alpha_i - \gamma [\ln Y_{i,t-1} - \theta \ln X_{it}] + \omega_{it} \quad (18)$$

Estimates for equation (18) are reported in Table 3, both for services imports and for FDI. In addition to the long-run composite delivery-based estimates (where we control for cross-price regulatory impacts), we also report traditional (uncontrolled) long-run estimates and a set of short-run estimates based on exactly the same sample to allow for direct comparison.⁸

The most striking result is that the direct effect and the indirect complementarity from FDI towards services imports are both reinforced in the long run, while the evidence becomes weaker in the opposite direction. Also, the standard (uncontrolled) approach yields a significant complementarity from FDI towards cross-border trade, but again no evidence from imports to investment. A detailed analysis by components of regulation indicates that services imports are affected over time not only by changes in foreign ownership barriers but also by other trade and investment barriers – such as regulatory barriers and tariffs – and by inward-oriented regulations – both barriers to entrepreneurship and state control. In contrast, for commercial presence, while inward-oriented regulations have a significant impact in both the short- and long-run, outward-oriented trade and investment barriers have only a short-run effect.

The stronger impact and complementarity from commercial presence towards cross border trade is evident also for individual services. Tables 4a and 4b summarize the price and cross-price effects by individual service sectors. Table 4a presents the short-run results, and Table 4b reports corresponding long-run elasticities. The estimates are always based on the long-run sample in order to control for potential sample bias. Communication services are sensitive to all dimensions of regulation, except regulatory barriers to trade

⁷ Within coefficients show a downward bias when there is heterogeneity between countries or endogeneity in the model. As a first point to note, the composite delivery approach, controlling for cross-price interactions, is likely to minimize the endogeneity problem compared to the uncontrolled one. Secondly, in our sample, only Asian countries show a different behaviour in the evolution of services trade. Moreover, Pesaran et al. (1999) also argue that short-time coefficients are more likely to vary across countries than the long-run parameters. Although we are aware of the simplification of assuming homogeneous coefficients, we can stress that also we would like to keep the same assumptions than in the short-run analysis, where we assumed common elasticities and country fixed effect, and for the initial experiment the main aim is to detect significant relationships. A previous analysis controlling for heterogeneity by including dummies for five different geographic regions reveals the downward bias of the within estimation but our elasticities keep their significance regardless whether we control for heterogeneity or not.

⁸ It can be noticed also that the short-run results are practically the same for this long-run sample and for the entire sample in the previous section. Only the index for state control is not significant for cross-border imports of services in the long-run sample. The differences in sample size arise from the calculation of growth rates for the long-run approach.

and investment. The same result was observed in the short-run. Other business services show a very significant direct price and complementary effect in all regulatory dimensions in the long run. Financial services, which show complementary effects in the short-run only when regulatory barriers to trade and investment change, are sensitive to all kind of regulatory changes, except tariffs, in the long-run. Construction services never show an effect from any aspect of product market regulation, and transportation services reveal a significant price effect from all inward-oriented regulations together with foreign ownership barriers but they never receive a significant indirect effect derived from a complementary relationship with FDI. Furthermore, the counterintuitive positive effects from tariffs in financial and transport services observed in the short-run seem to adjust over time, showing the expected negative effect in the long-run. It also appears that trade and investment barriers in general have the largest impact in all services. Looking into the sub-domains of this index, this trade inhibiting effect arises primarily from regulatory barriers in business services and financial services, and from controls on foreign ownership and high tariffs in communication services (see Table 4).

In summary, we have found a complementary relationship between cross-border imports and FDI triggered by their reaction to changes in outward-oriented regulatory measures in the short-run. Over time, our analysis reveals a more stable complementary relationship in reaction to changes in almost all aspects of regulation, especially so for communication, financial and business services. Some additional considerations merit further study in this context, such as the impact of country heterogeneity on the elasticities which we have obtained and the efficiency of the estimation methods used. Our analysis as it stands shows a significant and robust complementary relationship between the two main modes of services trade (cross-border and through foreign affiliates) in all producer related services but construction and transport. The general pattern is also one of a much cleaner view of these relationships over the long-run.

6 Conclusions

In this paper we have focused on the relationships between different modes of services trade. This has involved testing for whether the most important modes of delivery (cross-border trade and commercial presence) act as complements or substitutes. The empirical literature uses a traditional gravity approach when testing for this relationship - often with inconclusive evidence. In contrast, we offer here an analytical framework for studying cross-border and establishment modes (i.e. and trade and FDI) based on a model of joint

delivery of services. Based on this framework, we work with a new set of estimating equations that includes not only direct interaction between modes, but also indirect interaction linked to cross-price effects. We capture these cross-effects through the impact of regulatory indices. Our composite delivery approach, which combines FDI and services imports as different ways to serve domestic demand, offers an avenue for testing the hypothesis of complementarity versus substitution through the cross-price effects, which we can link directly to measures of existing regulations and other barriers to trade in services. Our approach predicts a complementary growth between FDI inflows and cross-border imports when the substitution elasticity is higher than the demand elasticity, and a substitutive effect in the opposite case.

Working with a new panel dataset spanning OECD trade and FDI in services for 1994-2004, we estimate both the standard (uncontrolled) and composite delivery approach (where we control for cross-price effects) model. For the aggregate of total services, the standard approach yields a complementary effect from FDI towards services imports, which is not significant when looking at the effects of cross-border imports on FDI. The composite delivery approach reveals a reciprocal complementary relationship in reaction to changes in domestic regulation (serving as an indicator of implicit and explicit barriers to trade in services). Moreover, we can distinguish which types of regulations have a larger impact. While cross-border service imports are more sensitive to outward-oriented barriers, trade through local presence (proxied for by FDI stocks) is sensitive both to inward-oriented regulations and trade and investment barriers and here in particular to changes in barriers restricting foreign ownership. Not all producer service sectors react alike. We can identify stronger and more stable effects to changes in regulatory regimes in communication services, where imports receive a clear positive impact from changes in FDI regulations.

The short-run evidence is corroborated in the long-run, showing a reinforcement of the complementary effect that imports receive from FDI when regulations change. The effect from cross-border trade on FDI is weaker. Total services imports grow directly in response to lowered regulatory obstacles as measured through any aspect of regulation, and they grow also through the FDI channel, again indicating net complementarity. On the other hand, FDI in services grows only when inward-oriented domestic regulations are removed, with no impact from outward-oriented barriers in the long-run. A detailed analysis by individual services sectors indicates again that cross-border trade in insurance and business services grows in response to any individual regulations being reduced, and communications and financial services are sensitive to almost all barriers. Only for transport and construction services imports do we find no evidence of net complementarity.

by **Vladimir Gligorov, Anna Iara, Michael Landesmann, Robert Stehrer and Hermine Vidovic**

wiiw Research Reports, No. 352, December 2008
136 pages including 35 Tables and 40 Figures
hardcopy: EUR 8.00 (PDF: free download from wiiw's website)

Migration and Commuting Propensity in the New EU Member States

by **Anna Iara, Michael Landesmann, Sebastian Leitner, Leon Podkaminer, Roman Römisch and Hermine Vidovic**

wiiw Research Reports, No. 351, December 2008
106 pages including 21 Tables, 16 Figures and 5 Maps
hardcopy: EUR 22.00 (PDF: EUR 20.00)

Real Convergence and Inflation: Long-Term Tendency vs. Short-Term Performance

by **Leon Podkaminer**

wiiw Working Papers, No. 49, December 2008
17 pages including 4 Tables and 6 Figures
hardcopy: EUR 8.00 (PDF: free download from wiiw's website)

International Trade and Economic Diversification: Patterns and Policies in the Transition Economies

by **Michael Landesmann**

wiiw Research Reports, No. 350, December 2008
87 pages including 17 Tables and 18 Figures
hardcopy: EUR 22.00 (PDF: EUR 20.00)

The Vienna Institute Monthly Report 12/08

edited by **Leon Podkaminer**

- Albania: the importance of being aside
 - Bosnia and Herzegovina: suffering from unfavourable constellations
 - Kazakhstan: commodity price decline aggravates crisis
 - Kosovo: risks to recovery
 - Montenegro: budget to the rescue
 - Serbia: risking recession
 - Statistics: Minimum interest rates, nominal exchange rates and real appreciation in Central, East and Southeast Europe, 2005-2008 (cross-country graphics)
- wiiw, December 2008
24 pages including 5 Tables and 9 Figures
(exclusively for subscribers to the wiiw Service Package)
-

The Vienna Institute Monthly Report 11/08

edited by **Leon Podkaminer**

- Russia in the global financial storm
- Ukraine: 'hard landing' in sight
- Croatia: slowing economy
- Macedonia: external balances worsen
- Turkey's nerves of steel
- Statistics: Consumer and producer prices; employees and unemployment in Central, East and Southeast Europe, 2003-2008 (graphics)

wiiw, November 2008

28 pages including 6 Tables and 10 Figures

(exclusively for subscribers to the wiiw Service Package)

The Role of Public Policy in Closing Foreign Direct Investment Gaps: An Empirical Analysis

by **Christian Bellak, Markus Leibrecht and Robert Stehrer**

wiiw Working Papers, No. 48, October 2008

23 pages including 8 Tables

hardcopy: EUR 8.00 (PDF: free download from wiiw's website)

The Vienna Institute Monthly Report 10/08

edited by **Leon Podkaminer**

- Bulgaria: can the boom hold on, and for how long?
- The Czech Republic: weak domestic demand, resilient exports, sound banking
- Hungary: outlook reconsidered
- Poland: a slowdown in the making
- Romania: record economic growth (
- Slovakia: backed by continued robust growth towards the eurozone
- Slovenia: signs of weakness
- Statistics: Selected monthly data on the economic situation in Central, East and Southeast Europe, 2007-2008

wiiw, October 2008

36 pages including 17 Tables

(exclusively for subscribers to the wiiw Service Package)

Economic Developments in the Wider Black Sea Region

by **Vasily Astrov and Peter Havlik**

wiiw Research Reports, No. 349, September 2008

(Reprint from: Daniel Hamilton and Gerhard Mangott (eds), *The Wider Black Sea Region in the 21st Century. Strategic, Economic and Energy Perspectives*, Center for Transatlantic Relations, Washington DC, 2008, pp. 121-145)

27 pages including 5 Tables and 1 Figure

hardcopy: EUR 8.00 (PDF: free download from wiiw's website)

Sectoral Productivity, Density and Agglomeration in the Wider Europe

by **Neil Foster and Robert Stehrer**

wiiw Working Papers, No. 47, September 2008

25 pages including 7 Tables

hardcopy: EUR 8.00 (PDF: free download from wiiw's website)

wiiw Service Package

The Vienna Institute offers to firms and institutions interested in unbiased and up-to-date information on Central, East and Southeast European markets a package of exclusive services and preferential access to its publications and research findings, on the basis of a subscription at an annual fee of EUR 2,000.

This subscription fee entitles to the following package of **Special Services**:

- A free invitation to the Vienna Institute's **Spring Seminar**, a whole-day event at the end of March, devoted to compelling topics in the economic transformation of the Central and East European region (for subscribers to the wiiw Service Package only).
- Copies of, or online access to, **The Vienna Institute Monthly Report**, a periodical consisting of timely articles summarizing and interpreting the latest economic developments in Central and Eastern Europe and the former Soviet Union. The statistical annex to each *Monthly Report* contains, alternately, country-specific tables or graphs with monthly key economic indicators, economic forecasts, the latest data from the wiiw Industrial Database and excerpts from the wiiw FDI Database. This periodical is not for sale, it can only be obtained in the framework of the wiiw Service Package.
- Free copies of the Institute's **Research Reports** (including *Reprints*), **Current Analyses and Forecasts**, **Country Profiles** and **Statistical Reports**.
- A free copy of the **wiiw Handbook of Statistics** (published in October/November each year and containing more than 400 tables and graphs on the economies of Albania, Bosnia and Herzegovina, Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Macedonia, Montenegro, Poland, Romania, Russia, Serbia, the Slovak Republic, Slovenia and Ukraine)
- Free online access to the **wiiw Monthly Database**, containing more than 1200 leading indicators monitoring the latest key economic developments in ten Central and East European countries.
- **Consulting**. The Vienna Institute is pleased to advise subscribers on questions concerning the East European economies or East-West economic relations if the required background research has already been undertaken by the Institute. We regret we have to charge extra for *ad hoc* research.
- Free access to the Institute's specialized economics library and documentation facilities.

Subscribers who wish to purchase wiiw data sets **on CD-ROM** or special publications not included in the wiiw Service Package are granted considerable **price reductions**.

**For detailed information about the wiiw Service Package
please visit wiiw's website at www.wiiw.ac.at**
