

MACEDONIA: Growth and instability

VLADIMIR GLIGOROV

Growth has been speeding up, yet is bound to flatten somewhat in the current year as well as in the medium term. This is primarily due to a slowdown in public investments and growing concern over political stability. Additional risks are linked to the crisis in Greece, despite their not being easy to forecast. Nonetheless, barring major economic improvements in the region, growth should settle down at around 3%.

Growth in 2014 has turned out better than expected due to both increased consumption and investment. It should slow down gradually in the medium term because of a deceleration of public investment in particular. Also, a possible increase in political instability will impact negatively on economic prospects.

Unlike most other countries in the Balkans, the Macedonian government has had enough room to pursue a cautiously expansionary economic policy, with an initial hike in wages in 2009 and a continuous flow of public investments. In addition, it has accelerated various structural reforms in order to accommodate foreign investments in particular. The latter have not been as plentiful as hoped for, but did not dry out as in some neighbouring countries. With this policy mix, growth has been supported and the record for the past five years as well as for the last and in all probability this year has been better than in most of the other transition countries.

The policy mix was accommodative and will remain so. Monetary policy has been especially accommodative, with the policy rate declining to just above 3%, which is low given the central bank's traditional concern over the stability of the exchange rate. There is scope for continued monetary relaxation, given deflationary tendencies, but this is unlikely to happen. Also, fiscal policy has been accommodative, especially given the traditional commitment to balanced budget policies. Again, some fiscal tightening with decreased public investments can be expected.

As in most other countries in the region, which import practically all oil and gas that they use, the fall in oil prices will be very supportive of the trade balance and also of domestic consumption. It will also relax the foreign borrowing requirements, which are significant due to a relatively large foreign debt. The energy bill is large in Macedonia as in most other less developed countries in the Balkans, so the positive effect of the fall of energy prices will be larger than in more developed countries.

The situation in the labour market continues to improve, which is exceptionally important because the unemployment rate has been very high for a very long time now. With continued recovery, even though

at moderate growth rates, employment should continue to increase, which will certainly contribute to social stability.

Political stability, however, is another matter. There have been several early elections during the crisis period, all of which were won by the government coalition. Still, the long duration of the same governing coalition is fuelling dissatisfaction in the public and with the opposition. This is neither extraordinary nor cause for undue concern. The government, however, seems to be taking the growing assertiveness of the opposition as a threat not only to its power but to the well-being of the state, which may prove additionally destabilising.

In summary, short-term prospects are for continued recovery, partly supported by the decline in oil prices and by continued growth of investment. For 2015 we expect GDP to grow by 3.5%, the same rate as in 2014. In the medium term, some growth moderation can be expected due to a slowdown in public investments and a possible flare-up of political uncertainty. The growth trend will centre somewhere below 3%. The current forecast does not differ substantially from the previous one, though 2014 turned out to be better in terms of GDP growth than forecasted.
