Box 3	Company data based on press reports	12

Abstract

The first part of the publication contains an analysis of the latest FDI trends complemented by detailed methodological explanations. After years of continuous growth, FDI inflows to the CEECs stagnated in 2008. Their decline in the NMS and in the SEE countries was compensated by a virtual boom in the CIS due to round-tripping Russian capital. In 2009 FDI is going to contract significantly, but it will still be more resilient to the crisis than other forms of foreign investment. Large FDI inflows in the past earn high rates of income to foreign investors who repatriate a growing share of their income. In some countries, in 2008 the amount of repatriated income exceeded the amount of FDI inflow. This negative direct effect of FDI on the balance of payments was partly countered by the foreign trade surplus generated by foreign affiliates. First quarter data indicate that in 2009 FDI may finance a bigger part of the, rapidly contracting, current account deficit than previously.

The second part of the publication contains two sets of tables: Tables I cover total flow and stock data according to the respective countries' central banks while Tables II provide more detailed FDI data by economic activity and by country. The main source of data are the central banks of the individual Central, East and Southeast European countries. FDI flows are taken from the balance of payments, stocks from the international investment position statistics.

Keywords: *foreign direct investment, balance of payments, income repatriation, statistics, new EU member states, Southeast Europe, CIS*

JEL classification: *C82, F21, O57, P23*

wiiw Database on Foreign Direct Investment in Central, East and Southeast Europe, 2009

Introduction

The annual presentation and analysis of FDI flows and stocks in the former transition countries comes in its fifth edition. The publication starts with methodological guidelines that are indispensable for understanding the meaning of the data and help in their correct assessment. Then we present an analysis of recent developments and prospects of FDI. It tackles all major issues brought forward by the latest statistics: FDI inflow and outflow, inward and outward stock, and changes in FDI by home country and by economic activity as well as FDI-related earnings. As a special topic we provide more detailed information on the balance of payments impacts of FDI. That analysis is followed by Tables I (total flow and stock data according to the respective countries' national banks) and Tables II (FDI data by economic activity and by investing country based on information from the national banks or from statistical offices). We included the most recent updates and backward revisions of data published by the national banks until mid of May 2009.

The database contains 3800 time series. Improvements of data availability and data revisions for past years have been incorporated. The *wiiw Database on FDI 2009* is available in printed format and PDF as well as on CD-ROM. The latter version contains longer time series and provides tables in HTML, CSV and MS Excel format. Detailed methodological guidelines enable the user to interpret the data correctly.

The *wiiw Database on FDI 2009* is the joint product of several wiiw specialists. Gábor Hunya developed the concept and prepared the analysis. Monika Schwarzhappel developed the database and the layout. Under her guidance, the wiiw statisticians Boriana Assenova, Nadya Heger, Beate Muck, Renate Prasch, Hana Rusková and Barbara Swierczek took care of the data compilation. Johannes Pöschl developed the CD-ROM software.

Methodological guidelines, definitions

The *wiiw Database on Foreign Direct Investment* is available in printed format and PDF as well as on CD-ROM.

Content of the print and PDF versions:

- FDI total inflow/outflow in EUR, 2000-2008
- FDI total inward/outward stock in EUR, 2000-2008
- FDI per capita (flow, stock) and selected other reference parameters on FDI, 2000-2008
- FDI inflow/outflow by form in EUR, 2000-2008
- FDI income (inflow and outflow) in EUR, 2000-2008
- FDI inward/outward stock data by activity (NACE rev. 1 A-Q, DA-DN), 2004-2007 or 2005-2008
- FDI inward/outward stock data by country, 2004-2007 or 2005-2008

The CD-ROM version (tables in HTML, CSV and MS Excel format) of the database contains in addition:

- longer time series: from 1990 onwards (as far as available)
- a more detailed breakdown by industry (NACE rev. 1 15-37)
- FDI inflow/outflow by activity (NACE rev. 1 A-Q, DA-DN, 15-37) and by home/host country
- FDI stock by form

Currency. The main data set is in euro, independently of the currency used by the source. If not published by the source, we converted flow data by the annual average exchange rate and stock data by the end-of-year exchange rate.

Data coverage. The new EU member states (NMS) as well as the candidate countries now follow the IMF definition and methodological guidelines, but deviations were frequent in the past. Their data cover all three forms of FDI (equity investment, reinvested profits, other investment – see below). Some Western Balkan countries still fail to report all forms of FDI. Information on data coverage is given in the ‘remarks’ following the individual tables. These remarks also call attention to the methodological changes over time, a basic problem in preparing time series.

Foreign direct investment. According to the IMF Balance of Payments Manual, Revision 5, capital investment abroad is regarded as foreign direct investment if the share of a foreign investor makes up at least 10 per cent of the target firm’s equity capital; that share can be as much as 100 per cent. The purpose of direct investment is to establish and maintain

permanent equity relations with a foreign company and at the same time to exercise a noticeable influence on the management of that company. This latter condition is difficult to implement and it can be assumed that more and more portfolio investment of equity funds is registered as FDI.

Foreign direct investment income. FDI-related incomes of non-residents are reported in the current account as outflows from the host country. Outward investors' earnings are booked as income inflows. The balance of payments statistics thus allocate FDI-related earnings according to the owner of the capital who generated the income. Foreign investment incomes fall under two categories: profits on equity investment and interest accrued on loans of the mother company to its foreign affiliate. As dividends and interest earnings are taxed differently, direct investors may choose between equity and loan as the form of FDI. In practice, the overwhelming part of FDI-related income is in the form of profits. FDI income outflows can either be reinvested in the host country or repatriated to the home country. Reinvested earnings add to the foreign direct investment inflow. When countries publish both detailed current account and capital account data, reinvested earnings can be deducted from the FDI income, which gives the amount of repatriated earnings.

Distribution of FDI by host/home country and by economic activity. The home country is the investor's country of origin, the host country is the target country of investment. These data are available based on company surveys reporting FDI stocks published by the national banks usually with one year delay. In the absence of national bank data, we rely on 'registration data' obtained from the statistical offices (this was done in the case of Albania, until 2006 Romania, and for Russia). The amount of FDI broken down by industry and investing country in Tables II may differ from the data in Tables I due to different coverage and source as indicated in footnotes.

We use the NACE rev. 1 classification for the breakdown by economic activities at the 1-digit level for the whole economy and at the 2-digit level for the manufacturing industry. The CD-ROM also includes a more detailed breakdown for the manufacturing industries NACE 15-37, where available. In addition, the CD-ROM contains data on inflows by activity, again where available, but in many cases only for some forms of FDI. The overview Tables I/13 to I/16 disregard differences in coverage and should therefore be treated as indicative only.

Forms of FDI

- Equity investment in cash and kind
- Reinvested earnings
- Other investment, mainly loans from the parent company to the subsidiary

Remarks at the end of the tables provide information on the form of FDI included in the flow and stock data of the individual countries. The FDI forms covered by statistics increases permanently, often without special note to the user. For example, in 2007, the Bank of Slovenia began to count into mutual liabilities among related firms also liabilities/credits among all the subsidiaries of the same parent company, and not only headquarters-subsidiary liabilities/credits as before, which caused a jump in FDI flows.

Host and home country statistics. These usually differ concerning the amount of FDI flows and stocks. Registration of flows in time may differ and the same transaction may be booked for different years. The country of destination or origin may differ as well. The *wiiw Database on FDI* only relies on host-country statistics and covers, e.g., Austrian FDI in the region in the way the individual CEECs report it.

Regions. The database covers twenty Central, East and Southeast European countries, grouped as follows:

- the new EU member states in Central Europe (NMS-5: the Czech Republic, Hungary, Poland, Slovakia, Slovenia), together with Bulgaria, Romania and the Baltic states (Estonia, Latvia, Lithuania) representing the NMS-10;
- Southeast Europe (SEE) including Albania, Bosnia and Herzegovina, Croatia, Macedonia, Montenegro and Serbia;
- the European CIS (Commonwealth of Independent States) members Belarus, Moldova, Russia and Ukraine. Asian CIS countries are not included in the *wiiw Database on FDI*.

All twenty countries are covered in the overview tables (Tables I) while only eighteen countries provide information on FDI by activity and by country (Tables II). Available data are added up to arrive at regional totals irrespective of country differences concerning coverage by form of FDI.

Revisions of data. When a more complete coverage of the various forms of inflows is achieved, the national banks adjust inflow and stock data, usually upwards. We make record of such adjustments in the database by replacing outdated figures. The growth rates of FDI in the analysis compare preliminary 2008 data with *revised* 2007 data, the latter being much higher than those published in the 2008 edition of the *wiiw Database on FDI*. As future revisions will bring upward adjustments, the currently published FDI figures for 2008 are most probably underestimated. Expected revisions render any forecast even more tentative.

Time coverage. The database covers all years from 1990 onwards for which data are available. The printed (and PDF) publication covers the past eight years in the overview

tables (Tables I) and the past four years in the country tables (Tables II). Users interested in time series from 1990 onwards should rely on the CD-ROM.

Source of flow data. We rely first of all on the national banks of the FDI host countries. According to international standards, the balance of payments published by the national banks contains the information on FDI inflows and outflows. Both these figures are in net terms, investment minus disinvestment.

Source of stock data. FDI stock data are contained in the international investment position provided by the national banks. They rely on company surveys, which also reveal the investing country and the main economic activity of the host company. These data are usually available with one year delay. For 2008 the national banks may provide preliminary data by aggregating flows in the local currency and converting them to euro using the end-of-period exchange rate. (A strengthening euro may 'devalue' past stocks while a weak year-end euro may result in a jump in FDI stocks larger than the annual inflow.) If stock data were not yet available for 2008, they have been estimated by wiiw, based on inflows and three-quarters stock data.

Special purpose entities (SPEs) are channelling funds (the direction and size of which are controlled by their parents) rather than being a target of direct investment (net flows on various financial instruments are close to zero taking a longer period). The most significant amounts are recorded in Hungary, some data are available for Poland as well. In accordance with the international statistical recommendations from January 2006, the Hungarian National Bank (MNB) compiles the balance of payments and the international investment statistics including SPEs. Based on economic considerations, the MNB continues to compile the balance of payments and international investment statistics excluding SPEs as readily interpretable in economic terms (www.mnb.hu).

Gábor Hunya

FDI in the CEECs under the impact of the global crisis: sharp declines

Global FDI trends: decline in 2008; more to follow in 2009

The current global crisis is primarily the product of the financial and capital markets, as they undergo adjustments following a massive over-expansion. In the real sector, production, foreign trade and direct investments decline strongly but much less severely than the financial sectors. In 2008 the global FDI flow is estimated to have contracted by 15% (OECD, 2009a). FDI inflows to OECD countries declined by 25% but outflows from there by 5% only (in current USD terms). The main reason for this asymmetry was that in developed countries the melt-down of asset prices brought down the value of mergers and acquisitions (M&A) very severely. At the same time, outward investors still had the capital to invest and found attractive targets, mostly in the emerging markets including the CEECs. It is expected that FDI will be more resilient than other capital flows to developing and emerging economies also in 2009.

The current crisis is not only deeper but it will also last longer than earlier assumed. According to another forecast by the OECD (2009b), the global economic decline will be as much as 2.7% while the OECD members will contract by 4.3% in 2009. In the euro area, GDP is going to drop by 4.1% in 2009 and 0.3% in 2010. Gross fixed investment will decline more than GDP and FDI even more than gross investments. UNCTAD predicts that FDI will fall much more than in the previous year (UNCTAD, 2009a). On a sectorial dimension, the drop in global FDI flows is expected to be most significant in financial services, automotive industries and building materials (UNCTAD, 2009b). Putting the trends into approximate numbers, global FDI inflows dropped from some USD 1900 billion in 2007 to 1600 billion in 2008 and may be just around 1000 billion in 2009. The latter sum is close to the figure of 2005, thus the current setback only corrects for the recent hype.

The causes of the FDI setback are manifold. The economic decline triggers a drop in FDI just as in fixed capital investments as a whole, due to falling global demand, excess capacities, difficulties in investment financing, the decline in subsidiary profits, etc. Overcapacities emerge which make new investments both in the home and host countries unnecessary. The export-oriented industries in particular cut output and put their capacities idle. FDI in the oil, gas and metals industries declines also due to low commodity prices. Tight credit conditions curtail FDI in two ways: credit-type FDI shrinks and the bank-financing of equity investments becomes more costly so that FDI projects may be cancelled or delayed due to the lack of affordable financing. Another important part of FDI, reinvested profits, contract when foreign investors' profits shrink. In addition, profits may be

withdrawn by parent companies from more successful locations to finance losses in the home country.

FDI in the CEECs in 2008: growth in the CIS, decline elsewhere

After years of continuous growth, FDI inflows to the CEECs basically stagnated at the previous year's level in 2008, in current euro terms (fall of 1%, Table 1). In the new EU member states (NMS) they declined by 9% (excluding special purpose entities, SPEs, in Hungary and Poland, see Box 1). In the Southeast European (SEE) countries the contraction was more severe, 22%. This was compensated by the surge of FDI inflows to the European CIS (+17%), to all the four countries in this region. But, as a major part of FDI flows to Russia is round-tripping capital which blows up statistics (Box 1); in reality there is no boom in the CIS either.

Among the NMS, Romania and Slovenia booked significant increases while Poland, Bulgaria and the Baltic states suffered declines. Some of these changes were the normal results of fluctuations due to one-time large projects in 2008 or the previous year. Only the declines in the Baltic states can be associated with the impact of the crisis which in these countries started ahead of the other CEECs and turned out to be more severe. In the Czech Republic, Hungary and Slovakia, FDI inflows in 2008 more or less stagnated at the previous year's level despite the very different macroeconomic situation in the three countries – a GDP boom in the Czech Republic and in Slovakia and close to stagnation in Hungary. In per capita terms, Estonia, Bulgaria and the Czech Republic were the largest FDI recipients just as in the previous year.

The Western Balkan countries, with the exception of Albania, suffered major setbacks of FDI flows in 2008. The main reason for the meagre inflow is, beyond the general but still modest economic slowdown, that most of the countries in the region have narrowly based economies and the foreign investment there is market seeking. One-time privatization deals boosted FDI in one or the other year but with time passing the opportunities for privatization become increasingly rare. Investors do not have a lasting interest in the region beyond taking under control the domestic-market-oriented services such as finance, retail and telecoms. They rarely set up export-oriented projects, therefore the Western Balkan countries have not yet succeeded in becoming part of international production networks as have the NMS. In per capita terms Montenegro and Croatia are the most significant recipients of FDI, due also to real estate investments in tourism.

In all four *CIS countries* investigated here, FDI continued to increase in 2008 according to the balance of payments statistics. These countries can still be considered relatively new targets of international investment flows. They attract capital by privatization and by providing new market access. Russia in particular is a diversified and large market which

had booming consumption and expanding natural resources sectors up to recently. However, FDI in Russia is most probably over-stated by round-tripping (Box 1). More than 30% of the FDI in Russia comes from Cyprus and a similar share of the outward FDI goes to that country, which means that it is Russian capital that returns to the country via Cyprus. The same may be true for the second largest investor and outward investment target, the Netherlands. Cyprus plays an important role also for Ukraine, where it is the most important investors with more than one fifth of the stocks, and it received almost the total amount of outward FDI from Ukraine.

Table 1

Overview of FDI in Central, East and Southeast Europe

Box 1

FDI in the CEECs – problems of measurement

Statistical reports on FDI in the CEECs do not always follow the internationally established rules and conventions (see Methodological guidelines). The first problem is that preliminary balance of payments data differ from the final data published with some years' delay. According to rules, revisions are necessary which transcribe the past at a time when the results are no longer of general interest. The wiiw revises statistics following the latest sources but we do not analyse the results of the revisions backwards.

The second problem is that sticking precisely to rules may distort the analysis. This is the case with the rule to include in the statistics the FDI of Special Purpose Entities (SPEs) which are transitory flows. By doing so the Hungarian National Bank and Eurostat report 3-12 times higher FDI inflows in Hungary than the statistics without SPEs. SPE-related inflows are balanced by the same amount of outflows and have no impact on the local economy. We find it correct to use the figures without SPEs, which are more relevant for the economy under consideration, and give the figures including SPEs in a footnote. (see also: Methodological guidelines, definitions)

A related problem is that for most other CEECs we have no information whether SPEs are allowed to operate in the country and whether their investments are included in FDI statistics. Poland is a partial exception. The Polish practice is to use inclusive data for earlier years and preliminary data excluding SPEs for the latest year. We established a line in Table 1 reporting data without SPEs based on Polish National Bank sources and estimated 2008 inflow and stock including SPEs for comparative purposes.

Russia is another problem case as it has lots of investments in low-tax countries such as Cyprus and the Virgin Island and the country receives similar amounts from those places. This is called round-tripping and can be attributed to SPEs set up by Russian firms in those countries. Data are not transparent, thus we have not ventured to calculate Russian FDI data without SPEs. We can only refer to the fact that the State Statistics Services can provide a breakdown of FDI inflow by economic activities for only EUR 18.4 billion for 2008 (Table II/17/2).

FDI outflows from the CEECs declined by 3% in 2008 mainly due to lower investments undertaken by the NMS, 25% less than in the previous year. The most significant setbacks were booked from Hungary, Estonia, Poland and Slovenia. Modest increases were recorded by the Czech Republic and Bulgaria. The outward FDI activity of the main investor, Russia, continued to increase in 2008, primarily to off-shore centres with the aim to being reinvested in the country.

All CEECs were net importers of FDI in 2008, even Russia and Slovenia which had been net FDI exporters in some previous years. Outflows from the NMS were only 16% of the inflows in 2008, less than a year earlier. The net FDI position of the CEECs by and large corresponds to their level of economic development. High positive net FDI allows the financing of current account deficits to a considerable extent (see below).

More decline to come in 2009

Integration into European corporate structures benefited the NMS up to recently by stimulating economic growth and exports. But the wide presence of foreign subsidiaries also facilitated the fast transfer of the crisis from Western Europe to the NMS through the corporate channels of banks and companies. Fortunately, the Western banks dominating the banking system in the NMS and SEE countries are not those which were most seriously and directly affected by the financial crisis. Nonetheless, they began restricting loans to their subsidiaries abroad when faced with a liquidity squeeze at home. Credit margins and risk premia increased so that companies' access to financing became more difficult. Export markets, later also domestic markets contracted and production had to be curtailed in the most important industries dominated by foreign affiliates. In the automotive and electronics industries as well as steel production – the branches most affected by declining demand – subsidiaries in the NMS cut back production and often laid off employees. Several companies have postponed investments given the uncertain demand for their products. In general there is no proof of foreign companies or banks aggravating the crisis in CEECs by selfish behaviour. Protective political pressure exists from home and host country governments alike to maintain workplaces and financial flows. In general, CEEC economies are strongly affected by the global recession and will experience declining GDP in 2009. (The possible exceptions are Poland and Albania.) All current trends point to a severe decline of FDI activities, but not to a sudden stop.

Table 2

FDI inflow at the beginning of 2009, change over 2008 in nominal EUR terms

(countries publishing monthly BoP data)

Country	Period, month	In % of previous year period
Bulgaria	I-II-III	- 46%
Czech Republic	I-II-III	+ 11%
Estonia	I-II-III	- 79%
Poland	I-II-III	- 44%
Romania	I-II-III	- 20%
Slovenia	I-II	- 67%
Serbia	I-II	- 13%
Russia	I-II-III	- 55%

Source: National banks of individual countries.

First signs of low FDI in 2009 are already visible at the beginning of the year, although one should be cautious in interpreting data due to seasonal fluctuations. The only country with higher inflows in the *first quarter of 2009* than in the previous year was the Czech Republic. In other countries FDI inflows in the first 2-3 months of 2009 were 20-80% lower than in the same period of the previous year (Table 2). Romania fared relatively well due to one single

deal: the payment for a car company bought by Ford last year was effected in 2009. A similar time-lag appeared in Serbia with the purchase of the Zastava car factory by Fiat.

There are many cases of investment and disinvestment behind the decline of FDI inflows (Box 2). Sporadic examples show that while most of the investors are still in a wait-and-see position, cost-sensitive production in the clothing industry is leaving the NMS, other companies curtail production and close one or the other subsidiary in the region, again others plan to move production from high-cost countries into the region.

Box 2

The impact of the crisis: recent FDI cases

Dell, the computer maker, announced it was shifting production from its factory in Limerick, Ireland to its plant in Lodz, Poland to save production costs. Hitachi, the Japanese electronics company, is closing a new flat-screen television factory in the Czech Republic because of a slump in demand (*Financial Times*, 12 May 2009).

Contract manufacturer Flextronics cuts 400 jobs in Hungary in the first quarter of 2009 (*Napi*, 6 February 2009). Flextronics is to add 100-200 people to its staff at its plant in Zalaegerszeg, Hungary (*Napi*, 23 April 2009). Informatics multinational NEC moves its regional centre to Hungary (*NOL*, 23 April 2009). Filtrona Filters moves the production of cigarette filters from England to Hungary (*Napi*, 3 April 2009). Belgian producer of underwear Van de Velde closes its production in Hungary and moves it to Tunisia (*Napi*, 7 January 2009).

Volkswagen announced to build a small family car factory in Slovakia and invest EUR 308 million (*The Slovak Spectator*, 27 April 2009). Construction started of a factory of the Chinese company Great Wall in cooperation with Bulgaria's Litex Motors which will manufacture SUV cars. The investment is around EUR 80 million. The first vehicles will be ready in late 2010 when the factory will be providing 3000 jobs (*Bulgarian News Network*, 15 May 2009).

Table 3

Number of FDI projects in the NMS

	Q1 2008	Q1 2009

Romania	71	41
Hungary	49	31
Czech Republic	36	22
Bulgaria	30	31
Slovakia	18	15
Latvia	11	10
Lithuania	8	8
Estonia	8	6
Slovenia	1	0
Total	325	207

Source: <http://www.fdimarkets.com>.

Aggregate company data are available through the '*FDI Intelligence*' (Box 3) which compiles press information. These data show that the number of new FDI projects and also the amount of invested capital declined substantially at the beginning of 2009 in comparison to the situation one year earlier (Table 3). The NMS received 325 new projects in the first quarter of 2008 but only 207 in the first quarter of 2009. What has not changed is that the most frequented NMS in both years were the two largest countries, Poland and Romania, followed with some distance by Hungary. In the fourth place we have the Czech Republic in 2008 and Bulgaria in 2009.

Box 3

Company data based on press reports

The second major data source, next to the balance of payments, tapped for this paper is 'FDI Intelligence from Financial Times Ltd' (<http://www.fdimarkets.com>), which allows for the most up-to-date analysis of FDI flows possible. The information is based on press reports thus the data should be taken as investment commitments. They refer to individual investment projects by source and destination country which are added up to countries. *FDI Intelligence* data differ principally and significantly from the FDI data reported in the balance of payments. While balance of payments data are published with delay and are backward looking, *FDI Intelligence* is continuously updated and is forward looking. *FDI Intelligence* includes first of all the number of projects, but it is incomplete concerning the amount of invested capital. Only new equity investment projects enter the database, thus it is a proxy for green-field investments. It does not cover other types of FDI, such as reinvested earnings and loans which enter the balance of payments statistics.

As to the *Southeast European countries*, the number of investment projects in the first quarter of 2009 was 39, two more than in the first quarter of 2008. In 2008 Serbia received two thirds of all projects, in 2009 only one third – Croatia and Montenegro recorded significantly more projects than before. There is no easy explanation for this beyond the increasing accuracy of data collecting in this region. In Russia the number of projects decreased only slightly from 95 in the first quarter of 2008 to 86 in the first quarter of 2009.

Forecasting the amount of FDI inflows for 2009 is not really feasible in the present circumstances. Based on global trends and the results in the first quarter of 2009 outlined above we expect FDI inflow to shrink to at least half of last year's level in the region as a whole. Despite a considerable decline, the amount of FDI to flow into the NMS may be about EUR 20 billion, which is similar to the sum these countries received at the beginning of the 2000s. There are no signs that one or the other country may be significantly less affected by the crisis in terms of FDI, thus we refrain from giving forecasts for individual CEECs.

Based on the latest data and the experience with earlier crisis situations, it is very likely that FDI will not dry out in the same way as portfolio investments. Current trends show that,

while larger FDI projects are delayed, smaller efficiency-improving investments are going on. Profits earned by companies are reinvested and also banks keep up part of their credit lines to the subsidiaries. The confidence of established investors will probably be sustained even under severe crisis conditions – if these do not last for too long. No massive termination of investment projects and repatriation of investment capital is expected.

Under lasting underutilization of capacities in Europe, multinational companies will be forced to restructure their production and sales networks. It is possible that more production will shift to low-cost NMS, and that some subsidiaries will be closed also in the CEEC region. Further investment opportunities may also appear. In the NMS, EU-financed projects which grow in amount this year and especially the next will attract investors. The countries of the Western Balkans may receive FDI in the regional energy sector which is less hit by the crisis due to a shortage of power generating capacities.

Inward FDI stock and its composition by investing country and economic activity

In 2008, the size of FDI stocks was higher in most countries than in 2007 (Table I/2). This basically reflects the effect of inflows. But the FDI stock is also influenced by the development of the exchange rate and the valuation of company assets (see Methodological guidelines). In countries where listed companies make up a large part of FDI, such as Hungary or Croatia, the decline of stock market prices caused FDI stocks to diminish.

Calculating *FDI stocks in per cent of GDP* gives an overall impression of a country's FDI exposure. This indicator (Table I/8) declined in countries where the GDP in euro terms increased more rapidly than did FDI, partly due to the appreciation of the local currency on annual average (e.g. Czech Republic, Slovakia). A country comparison reveals that Bulgaria has the highest FDI per GDP, followed by Estonia and, with some distance, by Hungary and the Czech Republic. In per capita terms Estonia is ahead of the Czech Republic and Hungary (Table 1). In 2005 Bulgaria was still behind Hungary in terms of FDI stock per GDP, but it has received relatively large inflows in recent years compared to the size of its economy. The FDI boom in Bulgaria has some peculiarities concerning its composition by economic activities: FDI has shifted from manufacturing and telecom to real estate and other business activities, to a minor extent also to financial intermediation and construction. A real estate boom was carrying most of the FDI expansion in 2007-2008 which has reversed more recently.

Most countries do not report *FDI stocks by investing country and economic activity* for the most recent year, thus we have comparative and aggregate data for 2007 only (Tables I/15, I/16 and Part II.). These data paint a different picture than what we face in 2009. 2007 was the year with rapid increases in prices of energy, steel and food, and also

share prices of listed companies rose rapidly. Thus it is no surprise that the share of such industries in the FDI stock increased e.g. in the Czech Republic where FDI in the metal and the chemical industries grew ahead of all other industries. In Hungary the coke and petroleum industry, in Poland and Slovakia the metal industry increased their shares in 2007 as compared to two years before. Manufacturing sector FDI usually lost shares to the financial sector and the 'real estate and other business activities' sector. In Southeast Europe also retail sector investments were booming while this sector was already quite saturated in the more advanced NMS.

Manufacturing was still the most important activity of FDI in Slovakia, the Czech Republic, Hungary, Latvia, Poland and Romania, among the SEE countries in Macedonia. These are the countries where FDI inflows also generated strong exports. In other countries where FDI went mainly into services, foreign investment cannot be expected to contribute much to exports. But also these countries were affected by the shift away from manufacturing to financial intermediation, as well as to real estate and other business activities in 2007.

Table 4

FDI stocks in the real estate, renting and other business activities sector, 2007, EUR million

NACE	Czech Rep.	Hungary	Poland	Romania	Slovenia
7000 Real estate	5723	3498	7751	2552	373
7100 Renting of machinery and equipment	235	103	511	518	8
7200 Computer activities	480	437	465	250	45
7300 Research and development	24	90	32	6	5
7400 Other business activities	4777	7717	8969	1167	567
Total: Real estate, renting and other business activities	11239	11845	17728	4493	998

Source: Eurostat and national banks.

The economic sector experiencing a boom in recent years is *real estate, renting and other business activities*. This is a very complex sector with subsectors of different characteristics. Based on a detailed breakdown of this sector, real estate development can be separated from 'other business activities' and some more sophisticated services (Table 4). An important and increasingly export-oriented activity is related to computers. As computer-related services have low capital intensity, the impact on exports and employment must be larger than indicated by the amount of investments. The Czech Republic, Poland and Hungary have attracted FDI of similar size into this sector in the course of the past 3-5 years. Some other countries that are very frequently quoted in the press for FDI in the computer-related services sector, such as Bulgaria, Romania and Serbia, do not show up in the statistics yet. The other large sub-sector next to real estate development is 'other business activities', which includes mainly consulting services and other activities. Most of the latter are holding companies with unspecified activities.

Among the *investing countries* in the NMS, Austria maintained its third rank in 2007 after Germany and the Netherlands. In the SEE countries as well as in Bulgaria and Romania, Austria ranked first by a wide margin as in previous years (Tables I/13, I/14 and Part II).

According to the *FDI Intelligence* database, the composition of investment projects in the NMS by economic activity in the first quarter of 2009 differs strongly from that in the previous year. At the beginning of 2008 the highest number of new projects was established in the automotive industry, followed by ICT & electronics. Construction and real estate development received the highest sum of investments, illustrating the still ongoing real estate boom in most countries. In 2009 most of the manufacturing industries have disappeared from the list of new investment projects. What has remained is retail trade, ICT & electronics and environmental technology comprising mainly alternative energy projects. The latter industries received not only numerous projects but also the highest amount of announced FDI capital. These projects have been eligible for EU subsidies and produce for the local markets, thus differing a lot from the export-oriented investment targets in earlier years.

The *FDI Intelligence* database shows the same major targets of foreign investment as the FDI stock data but they also reveal some shifts among investing countries in the NMS lately. In the first quarter of 2008 Austria accounted for the fourth highest number of projects in the NMS after Germany, USA and France. In the first quarter of 2009 Austria ranked second closely after Germany and ahead of the UK and the US. Austrian investments in the first quarter of 2008 had been most numerous in Hungary, while in 2009 the largest number went to Romania. Most of German investment projects in the first quarter of 2009 were equally distributed between the Czech Republic, Hungary and Bulgaria.

As for *Russia*, the main investing countries of the 570 investment projects in 2008 were the USA and Germany, followed with a distance by France and Japan. As this database records the real country of origin, no off-shore centres like Cyprus appear. In the first quarter of 2009 Germany accounted for 19, the US for 11 projects. The most frequented activities of 2008, “real estate and other business activities” and “financial intermediation”, almost disappeared in 2009, and the production of industrial machinery became the most important industry. In Southeast Europe, also, financial intermediation and real estate projects disappeared in the first quarter of 2009. Only 39 projects were initiated, 6 of them in the food sector (including production and retail) which had also been among the most important sectors in the previous year. The impact of the crisis is similar in all CEECs – there are less investment projects altogether and almost none in the branches most effected by the crisis.

FDI both finances and creates current account deficits

High current account deficits appeared in the course of the externally financed economic boom in several countries in 2007-2008. The current account deficit in per cent of GDP was low only in the Czech Republic, higher but moderate in the range of 5-6% in Hungary, Poland, Slovakia and Slovenia (Table 5) while in the Baltic countries and Southeast Europe it reached 15-25%. High deficits were to a large but decreasing extent financed by net FDI. Back in 2005, FDI had financed at least half of the current account deficit in eight NMS, and four of them featured an FDI inflow that was higher than the current account deficit. The situation worsened in subsequent years and in 2008 only the Czech Republic had an amount of net FDI in surplus of the current account deficit and only Bulgaria, Romania and Slovakia financed more than half of the current account deficit by FDI. The rest of the region relied on more volatile sources of financing.

Table 5

FDI and current account position

	Current account % of GDP				FDI income balance % of CA				FDI net % of CA deficit			
	2005	2006	2007	2008	2005	2006	2007	2008	2005	2006	2007	2008

Source: wiiw Annual Database incorporating national bank statistics.

FDI does not only finance but also creates current account deficits. The current account includes the total income (profits and interest earnings) of the foreign investors in the country as outflows. (Incomes earned by outward FDI are treated as inflows and are still insignificant for the NMS.) In mature FDI receivers the income of foreign investors makes up more than half of the current account deficit (Table 5). This was the case in all five Central European NMS and Estonia in 2008. For these countries the major source of external deficits is not the trade or the services account, but the income accrued by foreign investors.

Foreign investment enterprises have become more profitable over time. The FDI-related income (outflow) relative to the inward FDI stock provides the rate of return on the foreign investment (Table 6). These rates are particularly high in Hungary (18%) and the Czech Republic (14%). In most other countries they are at about 10% which is still a fairly good rate. High and increasing profit rates prove that the region has been an attractive FDI

location. It also suggests that mature FDI receivers get relatively little new FDI compared to the amount of income foreign investors earn there.

Table 6

FDI-related income (outflow) relative to inward FDI stock, selected countries, %

	2002	2003	2004	2005	2006	2007	2008
Czech Republic	9,1	10,3	11,7	10,4	12,0	14,6	14,4
Hungary	9,7	8,3	9,6	9,1	13,6	18,2	18,4
Poland	1,7	4,0	12,1	9,7	11,0	11,3	10,1

Ukraine	1,9	1,3	2,1	1,5	4,5	3,3	.

Source: Tables I/2 and I/11.

Part of the foreign investors' income is *reinvested* and is booked as FDI inflow on the financial account of the host country, another part of it is repatriated, leaving the host country. It is the interest of the host country to keep as much FDI-related income as possible in the country. This has not been the case in recent years. The share of *repatriated income* in the total income of foreigners increased with time. In the mid-2000s about half of the income was repatriated from the five Central European countries plus Bulgaria and Romania (Table 7). In 2008 the average rate of repatriation was about 70%, the highest in the history of the region. Slovenia, Slovakia, Bulgaria and Hungary were above the average, the Czech Republic significantly below. Income repatriation has generally been low from the Baltic states, perhaps due to local strategies of Scandinavian investors.

High rates of FDI related income and high repatriation rates have resulted in net "*inward-FDI-related outflows*" in several countries in the past couple of years (Table 8). In 2008, in Hungary the income of investors was twice as high as the FDI inflow, in the Czech Republic it was higher by 38%, in Slovakia by 36%. The two figures were close to each other in Poland and in Estonia, while the FDI inflow was higher than incomes in Bulgaria and Romania. In general the more mature a country as a recipient of FDI, the more it loses in terms of income to foreign owners. In this calculation reinvested profits were double counted, once as part of the incomes and again as part of FDI inflows.

Table 7

Share of repatriated income in FDI income outflow, %

	2002	2003	2004	2005	2006	2007	2008
Czech Republic	37,8	48,4	51,8	51,1	57,8	54,5	57,7
Hungary	43,0	43,7	49,6	59,6	80,6	79,3	71,2
Poland	262,9	104,1	35,3	63,3	56,5	51,0	63,5
Slovakia	.	20,3	36,1	68,1	64,9	78,3	81,8

Croatia	57,5	33,9	52,7	33,0	33,7	56,0	62,2
Russia	77,8	43,6	48,2	52,0	57,5	45,9	48,4
Ukraine	98,2	86,2	96,5	98,6	96,5	98,6	.

Source: Table I/11.

Taking only the repatriated income in relation to FDI inflow (which includes reinvested income) we get the net direct effect of FDI on the balance of payments. Hungary had a high negative balance and Slovakia a small one in 2008 (Table 8, last row). Income repatriation and FDI inflow were of almost equal amount in the Czech Republic. High positive balances appeared in Bulgaria and Estonia. Also this indicator tends to grow as FDI matures and indicates *growing net losses* a country suffers due to FDI.

The above trend of low FDI inflow in relation to investors' income has important economic policy implications. While in the past foreign investors provided an indispensable technical and organizational stimulus to the successful transformation and modernization of CEE economies and also financed a substantial part of the current account deficit, more recently FDI has become a source of permanent income outflow and creates more current account deficit than it finances. An overall negative balance of payments effect of FDI is something that governments have not envisaged and it has also not been discussed much in FDI-related research.

The negative effects of the repatriation of FDI-related income can be balanced by other positions in the balance of payments. In the ideal case, foreign investors *establish export capacities*; thus, when the income balance turns highly negative, it can be compensated by the improving foreign trade balance. In fact, trade deficits of goods with the EU-15 have turned into surpluses and exports of services have also started to grow more rapidly than imports in countries such as the Czech Republic and Hungary. But export growth has by far not been enough to compensate both the high import content of exports and the surge

of income repatriation in most countries. The Czech Republic with its FDI inflow outpacing the current account deficit is the exception. Efforts to direct FDI further to export-generating investments are therefore desirable; the same holds for the reinvestment of incomes. This could be encouraged by promoting new investment possibilities in technologically more advanced, higher value-added and R&D-intensive products.

Table 8

FDI inflow and income repatriation, 2008, EUR million

	Bulgaria	Estonia	Czech Rep.	Hungary	Poland	Romania	Slovenia	Slovakia
FDI inflow	6163	1366	7329	4406	10970	9084	1239	2323
FDI income (outflow)	2190	1389	11830	11560	12090	4689	732	3153
Repatriated FDI income (outflow)	1691	378	6820	8232	7675	3104	716	2579
FDI inflow/repatriated FDI income (outflow), %	364	361	107	54	143	293	173	90

Source: Tables I/1, I/11.

The current crisis will change the existing picture of the foreign sector's performance in relation to the balance of payments. In 2009 the current account deficit will shrink very fast in the NMS and the SEE countries due to lack of external financing. A net outflow of foreign private sector credits and portfolio investments is expected, while FDI will be positive although lower than earlier. Official credits and EU transfers will substitute for some of the shortfall in external financing but allow for much smaller current account deficits than before. FDI will again play a bigger role in balancing the current account. Already in the first 2-3 months of 2009, the declining FDI inflow financed a higher share of the contracted current account deficit than in the previous year.

It is too early to predict what decision investors will make concerning their 2008 profits which will be included in the FDI data published later in 2009. The current year will most probably bring little or no profit for investors so there will be nothing to be repatriated or reinvested next year. This will keep FDI depressed for at least another year.

1) See footnote 1) in Table I/1. - 2) The respective values including SPEs in 2005-2008 are: 25981, 43325, 89047, 124297. - 3) wiiw estimate.

Remarks Table I/4:

Czech Republic: equity capital + reinvested earnings from 1997 + loans from 1997.

Hungary: equity capital + reinvested earnings from 1995 + loans from 1995.

Poland: equity capital + reinvested earnings + loans from 1996.

Slovak Republic: equity capital + reinvested earnings + loans.

Slovenia: equity capital + reinvested earnings + loans.

Bulgaria: equity capital + reinvested earnings + loans.

Romania: equity capital + reinvested earnings + loans from 2004.

Estonia: equity capital + reinvested earnings + loans.

Latvia: equity capital + reinvested earnings + loans. From 2000 change in methodology and range of entities regarded as residents.

Lithuania: equity capital + reinvested earnings + loans from 1996. From 2005 joint stock companies valued at market value (book value before).

Albania: equity capital + loans from 2006; cumulated outflows from 2004.

Bosnia and Herzegovina: not available.

Croatia: equity capital + reinvested earnings + loans.

Macedonia: equity capital + reinvested earnings + loans.

Montenegro: equity capital cash; cumulated outflows from 2001.

Serbia: not available.

Belarus: equity capital + reinvested earnings + loans from 2001.

Moldova: equity capital + loans from 1995.

Russia: equity capital + reinvested earnings from 1997 + loans from 1997; cumulated outflows until 1999.

Ukraine: equity capital + reinvested earnings + loans from 2005; cumulated outflows until 1999.

Sources: Respective national banks according to international investment position (IIP). Cumulated outflow (Table I/3 in EUR) for some countries as mentioned in the remarks.

- Serbia: risking recession
- Statistics: Minimum interest rates, nominal exchange rates and real appreciation in Central, East and Southeast Europe, 2005-2008 (cross-country graphics)

wiiw, December 2008
24 pages including 5 Tables and 9 Figures
(exclusively for subscribers to the wiiw Service Package)

wiiw Service Package

The Vienna Institute offers to firms and institutions interested in unbiased and up-to-date information on Central, East and Southeast European markets a package of exclusive services and preferential access to its publications and research findings, on the basis of a subscription at an annual fee of EUR 2,000.

This subscription fee entitles to the following package of **Special Services**:

- A free invitation to the Vienna Institute's **Spring Seminar**, a whole-day event at the end of March, devoted to compelling topics in the economic transformation of the Central and East European region (for subscribers to the wiiw Service Package only).
- Copies of, or online access to, **The Vienna Institute Monthly Report**, a periodical consisting of timely articles summarizing and interpreting the latest economic developments in Central and Eastern Europe and the former Soviet Union. The statistical annex to each *Monthly Report* contains, alternately, country-specific tables or graphs with monthly key economic indicators, economic forecasts, the latest data from the wiiw Industrial Database and excerpts from the wiiw FDI Database. This periodical is not for sale, it can only be obtained in the framework of the wiiw Service Package.
- Free copies of the Institute's **Research Reports** (including *Reprints*), **Current Analyses and Forecasts**, **Country Profiles** and **Statistical Reports**.
- A free copy of the **wiiw Handbook of Statistics** (published in October/November each year and containing more than 400 tables and graphs on the economies of Albania, Bosnia and Herzegovina, Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Macedonia, Montenegro, Poland, Romania, Russia, Serbia, the Slovak Republic, Slovenia and Ukraine)
- Free online access to the **wiiw Monthly Database**, containing more than 1200 leading indicators monitoring the latest key economic developments in ten Central and East European countries.
- **Consulting**. The Vienna Institute is pleased to advise subscribers on questions concerning the East European economies or East-West economic relations if the required background research has already been undertaken by the Institute. We regret we have to charge extra for *ad hoc* research.
- Free access to the Institute's specialized economics library and documentation facilities.

Subscribers who wish to purchase wiiw data sets **on CD-ROM** or special publications not included in the wiiw Service Package are granted considerable **price reductions**.

**For detailed information about the wiiw Service Package
please visit wiiw's website at www.wiiw.ac.at**

To
The Vienna Institute
