Unlike other Balkan countries, Macedonia was running a near-balanced current account in about the last two years. This year, however, exports are sluggish while imports are growing strongly; the trade deficit has widened and so has the current account deficit. Exports are expected to rebound later in the year and imports to decrease, but this is not going to be enough to bring the trade and current account deficits down by much.

Inflation is contributing to these developments. Macedonia has a fixed exchange rate with the euro and the eurozone countries are its most important trading partners. Therefore, a higher real exchange rate is having an influence on the competitiveness of Macedonian exports while imports are being helped by it. In the second quarter of 2008 inflation seems to be slowing down. This is partly a season effect, because the price of food is declining. It is also for the reason that Macedonian inflation has been fuelled by wage increases, which are now over. Real wages have been declining and their growth may have turned negative lately.

Another reason that may be contributing to the widening of external deficits is increased foreign direct investment in the first quarter of the year. At about EUR 200 million, FDI has been almost as high as for the whole last year. It is, however, not likely that foreign investments will continue coming in at that rate in the future.

GDP and industrial production should continue to grow at a rate of about 5% per year in the medium run. The boost to growth from domestic consumption should decline in importance, and investments and exports should again take over. Because of the firm peg to the euro, Macedonia cannot afford high inflation rates. Also, persistent external imbalances are risky. Therefore, growth has to rely on exports. The prospects should be good given the structure of exports, which is dominated by raw materials, metals and food, and given the growth prospects of major trading partners in the region (Serbia and Kosovo).

Political stability has continued to improve even though the early parliamentary elections in June have proved to be turbulent because of the conflicts between the rival Albanian parties. The governing coalition of Macedonian parties has secured the majority of seats in the parliament and could govern alone, though it is expected that it will form a coalition with one of the Albanian parties.

This election result will also strengthen the government in its negotiations with Greece over the name of this state. Greece blocked Macedonia’s entrance into NATO and is threatening to do the
same when it comes to the start of negotiations with the EU. A strengthened Macedonian government will be hard to pressure to accept an unfavourable compromise. For the time being that should have no perceptible negative economic effects. In the medium term it could prove to be a problem because all other countries in the Balkans should make advances in EU integration and Macedonia would be left behind.
